An external urinary catheter device for the relief of
5 male urinary incontinence.

A B S T R A C T

An external urinary catheter for the relief of male
urinary incontinence is provided. The catheter
10 comprises a contact member which is adapted to be
engaged with at least the extreme portion of a penis,
said contact member being connected to a discharge
conduit via an opening in the distal end section of the
contact member. The catheter is provided with an
15 aperture. A membrane, which is capable of selectively
passing gases but retaining urine, is fastened to the
surface surrounding the aperture. The membrane is at
least partly protected by a shield. At least one vent
for allowing gases to be in substantially unhindered
20 contact with the external surface of the membrane is
arranged in the catheter.
